

Business Intelligence On-Demand Delivery Platform

The VMT Business Intelligence Delivery Platform provides a robust infrastructure to deliver on-demand actionable data for your users. This VMT hosted environment provides all of the infrastructure components needed to support your BI needs.

The Delivery Platform retrieves data from your data sources, prepares the data in our data warehouse and delivers it to your users in the form and style they want to see it. Data updates can occur in real time or at intervals defined by your end users' needs.

The platform provides the combined capabilities a mid-sized organization needs to gain the power of BI. Based on Microsoft's SharePoint®, the platform combines:

- Web-based, hosted BI infrastructure platform with failover capabilities
- BI platform is virtualized providing failover redundancy and extensibility of applications
- Pre-configured BI solution with metrics defined and delivered
- Data warehouse provides central repository for your dispersed data
- Flexible dashboard and scorecards
- Customization services to tailor the solution to meet your unique needs
- Ongoing maintenance of the data connection points and available metrics
- Graphical delivery options for end-users
- VMT can also host the BI platform within your network walls
