

VMT Security Audit – How Safe is Your IT Environment?

It is estimated that one out of every four businesses had a security breach of their IT system over the past year. In addition, the impact of worms and viruses has cost businesses and government tens of billions of dollars in the past year.

Industry analysts estimate that 40% of security breaches are targeted at specific organizations – including both internal and external attacks (disgruntled employee, industrial espionage, etc.).

To help organizations understand their exposure to these elements, Virtual Management Technologies (VMT) has developed a highly specialized Security Audit service. The VMT Security Audit uses specialized software to scan your entire IT environment including servers, network and desktops. The VMT Security Audit performs the following functions:

- **Scans entire network – all components, all sites**
- **Gathers and analyzes data on system vulnerabilities**
- **Attacks and exploits any known holes in the server software**
- **Examines the likelihood of the systems being vulnerabilities**
- **Defines how to fix all found vulnerabilities**
- **Creates security report**

The power of the VMT Security Audit is that it not only lets you know the network vulnerabilities your organization has, but provides the specific process to close the holes. VMT also provides automated tools to close all holes and secure your IT environment.

The Security Audit Report summarizes:

- **Vulnerabilities by Risk Level**
- **Vulnerabilities by Accounts**
- **Description of each fix required**

To learn more about the VMT Security Audit and how it can help your organization understand and fix its security vulnerabilities, contact Virtual Management Technologies at 770-751-1110 ext 111, or visit our web site at www.VMTech.net.
